

# Annotation Challenges

15/12/2025

## 1. Cross-Linguistic Common Issues

### 1.1 Unclear referent

Several annotation difficulties recur across multiple languages, often stemming from shared linguistic or narrative phenomena. The most pervasive challenge in character mention annotation across multiple languages is the resolution of unclear referents, primarily driven by linguistic structures that omit or obscure the identity of the actor or entity being discussed. This issue manifests in three key ways: pronoun ambiguity, collective/generic mentions, and zero anaphora.

- Pronoun ambiguity arises in all languages where a lack of grammatical gender or flexible narrative focalization can make it difficult to determine the antecedent of a pronoun without deep contextual analysis. For example, the pronoun “she” can ambiguously refer to either of two female characters mentioned in a scene.
- Similarly, collective and generic mentions, such as the Chinese “长官” (the officer), the English “the five of them” and the Italian “*la squadra*” (the team) present a dual challenge: first, determining if the term refers to a group of specific characters or it is a generic group mention; and second, if specific, linking it to the correct individuals as the same collective pronoun can be used to refer to different individuals in different parts of the story.
- Finally, the widespread use of zero anaphora (subject/object omission) in pro-drop languages like Bahasa Indonesia, Italian, and Korean forces annotators to insert implicit referents based solely on discourse context, as seen in the Korean example where the subject “you” is entirely omitted from the clause.

These phenomena collectively demand that annotation moves beyond surface-level text analysis to incorporate inferential reasoning about character roles and narrative context. Table 1 below shows some representative cases selected from the annotation discussion.

Table 1. Unclear referent examples

| Problem             | Example                                                                                                                                                                                                                                         | Analysis                                                                                                                                                                                  |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Same-Gender Pronoun | <b>Chinese:</b> 曾可妮拿她没法, 在停车场找到了自己的自行车后, 便让刘令姿坐着后座, 和她骑车到便利店。(Zeng Ke Ni couldn't do anything about her. After finding her own bicycle in the parking lot, she let Liu Lingzi sit on the back seat and rode with her to the convenience store.) | The third-person pronoun “她”(her) is ambiguous between two female characters (Zeng Ke Ni and Liu Lingzi) due to a lack of grammatical gender differentiation and to the pro-drop grammar. |

| Problem             | Example                                                                                                                                                                                                 | Analysis                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Same-Gender Pronoun | <b>Spanish:</b> <i>De repente, el lobo emitió un gruñido increíblemente escalofriante y sus ojos se dilataron.</i> (Suddenly, the wolf let out an incredibly chilling growl, and his/her eyes widened.) | The possessive pronoun “ <i>sus</i> ” (his/her) creates ambiguity: do the eyes belong to the wolf or to another nearby character? This is exacerbated by flexible narrative focalization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Unmarked Plurality  | <b>Spanish:</b> <i>Ellos se miraron por un segundo. - ¡Me gustas!</i> (They looked at each other for a second. —“I like you!”)                                                                          | The plural pronoun “ <i>Ellos</i> ” (They) explicitly refers to multiple characters. However, the subsequent quoted dialogue uses the grammatically singular second-person object pronoun “ <i>Me</i> ” (to me) and the singular verb form “ <i>gustas</i> ” (like, 2nd person singular). From context, it can be inferred that the statement “ <i>¡Me gustas!</i> ” is spoken in unison by the multiple characters referred to by “ <i>Ellos</i> ”. Consequently, the singular surface forms “ <i>Me</i> ” and “ <i>gustas</i> ” functionally serve as a plural reference, collectively representing the shared sentiment of the group. This presents a coreference challenge where the grammatical number (singular) contradicts the pragmatic, referential number (plural). |
| Collective Mentions | <b>English:</b> Friday mornings were always the same for the five of them;                                                                                                                              | With collective group noun phrases with numerals (“the five of them”) used as a label for a group of characters, the specific individual characters that are included in the group need further distinction, which can also change in the course of the narrative.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Collective Mentions | <b>Italian:</b> <i>la squadra, gli altri, i cuccioli</i> (the team, the others, the puppies)                                                                                                            | Italian stories use many collective forms which must be linked to the set of individual characters they include. However, collective names can be used to refer to different groups of characters (e.g. “ <i>la squadra</i> ” mentioned differently across passages).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Problem      | Example                                                                                                                                                                                   | Analysis                                                                                                                                                                                                                                                                                                                            |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Zero pronoun | <b>Spanish:</b> <i>Si limitò a risponderle.</i><br>([He] limited himself to replying [to her].)                                                                                           | Both subject and object are implied; the omitted grammatical subject and the pronominal clitic “ <i>le</i> ” entail two participants.                                                                                                                                                                                               |
| Zero pronoun | <b>Korean:</b> “가긴 하는데요, 내일 저 데리러 학교로 와야 돼요.” (“I’m going, but [you] have to come to school tomorrow to pick me up.”)                                                                     | The subject of the second clause “와야 돼요” (have to come) is omitted but contextually refers to the listener “[you]”. Zero anaphora is very common in pro-drop languages like Korean, where the addressee must be inferred and annotated as an implicit referent. In this case, inferred based on the dialogue speaker and addressee. |
| Zero pronoun | <b>Bahasa Indonesia:</b> <i>Mengusap punggung tangannya perlahan dengan gerakan-gerakan yang menenangkan.</i><br>([He] gently stroked the back of his hand with slow, calming movements.) | The sentence contains no explicit subject. The agent performing the action “[He]” is entirely omitted, requiring annotation of a zero pronoun based on discourse context.                                                                                                                                                           |

## 1.2 Nominal Phrase Complexity

A second major cross-linguistic challenge involves the accurate annotation of complex nominal phrases, where descriptive or nested structures function as unique character identifiers. The difficulty lies not in identifying a mention, but in correctly determining its span boundaries and referential specificity. This task is made even more complex by literary traditions that employ elaborate epithets and descriptive chains to characterize figures. For example, in the Iliad, “brilliant swift-footed Achilles” is not merely a name but a formulaic epithet that encapsulates the hero’s essential qualities. Similarly, in modern fiction and narrative texts in various languages, extended descriptive phrases serve both to identify and to qualify characters, blending reference with depiction. Table 2 below shows the representative cases selected from the annotation discussion.

In languages like Chinese, the iterative use of particles like “-的” can create deeply embedded nominal hierarchies, requiring annotators to parse and extract the relevant character mention from within a larger descriptive unit. Similarly in Korean, extended descriptions build layered nominal phrases that are syntactically unified through the agglutinative use of particles and modifiers like “-는”. Conversely, in languages like Bahasa Indonesia, annotators may also make mistakes by just annotating only the head noun (e.g., “*pria*”/man) and omit critical modifiers (e.g., “*di belakangnya*”/behind him) that are essential for unique identification. Furthermore, descriptive phrases such as “the one who’s ‘taking care’ of Peter” in English or “*doncel sin pareja*” (unmated young man) in Spanish also sometimes lead to annotation disagreements. The annotation task requires determining, through narrative context, when such phrases cease to be descriptive and become a referential tag for a specific character, necessitating the annotation of the full, complex span to maintain referential clarity.

Table 2. Nominal phrase complexity examples

| Problem                     | Example                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Analysis                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Compound Descriptive Phrase | <b>Chinese:</b> 抓捕麻瓜出身的巫师的<br>小队 (the squad that<br>arrests Muggle-born wizards)                                                                                                                                                                                                                                                                                                                                                                                   | Iterative use of the “-的” (de) particle creates deeply nested nominal structures, where mentions (e.g., “Muggle-born wizards”) are embedded within larger agentive phrases (“the squad”).                                                                                                                                                                                                                                                                      |
| Descriptive Clause          | <b>English:</b> You’re the one who’s<br>'taking care' of Peter.                                                                                                                                                                                                                                                                                                                                                                                                    | A complex descriptive noun phrase uniquely picks out a specific character (Bucky) in context, functioning as a referential label rather than a generic description.                                                                                                                                                                                                                                                                                            |
| Compound Descriptive Phrase | <b>Korean:</b> 어깨에 커다란 악기를<br>짊어지고 가는 사람부터 밤 새<br>공부에 매진했는지 피곤한 기색이<br>역력한 사람, 자유분방한<br>차림새의 사람들까지. 젊음,<br>자유, 그리고 가능성! 지웅은<br>그런 에너지를 느끼는 게<br>싫지만은 않았다. (From people<br>carrying large instruments on their<br>shoulders, to people whose<br>exhausted appearance suggested they<br>had devoted themselves to studying<br>all night, to people with free-spirited<br>attire. Youth, freedom, and<br>possibility! Jiwung did not dislike<br>feeling that energy.) | A complex nominal phrase construction through stacking descriptive clauses. The mentions are not simple nouns but elaborated descriptions that blend physical portrayal (“피곤한 기색이 역력한 사람”) with social or personality cues (“자유분방한 차림새”). The annotation must capture the full span of each description to retain its referential and characterizing function, while also deciding whether these are generic groups or narrative-specific collective mentions. |
| Nominal Phrase              | <b>Bahasa Indonesia:</b> <i>Sang adik</i> (the<br>younger sibling), <i>adik tersayang</i> nya<br>(her/his beloved younger sibling), or<br><i>pria yang ada di belakangnya</i> (the<br>man who was behind her/him)                                                                                                                                                                                                                                                  | Annotators often marked only the head noun and forgot to include its modifiers. Examples were usually annotated only as “ <i>adik</i> ” or “ <i>pria</i> ” before the curation.                                                                                                                                                                                                                                                                                |
| Spanish                     | <b>Spanish:</b> <i>Lo peor que podía pasarle<br/>a un doncel sin pareja sería quedar<br/>marcado de por vida.</i> (The worst<br>thing that could happen to an<br>unmated young man would be to be<br>marked for life.)                                                                                                                                                                                                                                             | “ <i>Doncel sin pareja</i> ” refers here concretely to a character but may be used as a generic in other contexts.                                                                                                                                                                                                                                                                                                                                             |

### 1.3 Literary Devices, Fantasy Elements, and Narrative Strategy

Annotation challenges extend beyond grammatical structure into the realm of authorial style

and fictional world-building. These issues often require an understanding of narrative conventions.

- A primary challenge is distinguishing diegetic (in-story) referents from non-diegetic ones, as seen with the second-person narrative “you”, which addresses the reader and should not be annotated as a story character.
- The narrative point of view may shift, creating challenges in understanding the referent of a first person pronoun like “I”.
- Fantasy and supernatural elements introduce unique referential complexities. This includes characters with overlapping or transforming identities (e.g., Castiel/Emmanuel in Italian), non-human entities that function as characters (e.g., a wolf, a puppy), and metaphysical concepts like a “soulmate” that the narrative defines as a real, existing person.
- The use of synecdoche (where a body part like “Viola’s eyes” functions as a character mention) can create a mismatch between syntactic form and semantic reference.

These cases demand that annotators leverage both a deep understanding of the specific fictional universe’s rules and broader narrative literacy to make consistent decisions. Table 3 below shows some representative cases selected from annotation.

Table 3. Literary devices, fantasy elements, and narrative strategy example

| Problem                    | Example                                                                                                                                                                                             | Analysis                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Out-of-storyworld referent | <b>Chinese:</b> 自从他的过去仿佛淡出了我的脑海, 这很可怕, 你看着这个男人, 根本想不到他是个凶残的食死徒. (Since his past seemed to fade from my mind, it’s terrifying. You look at this man and cannot imagine he is a vicious Death Eater.) | The second-person pronoun “你”/you in this example does not refer to a character within the narrative world but serves as a stylistic device to directly address the reader, drawing them into the narration. This is a case of narrative intrusion. While a pronoun, it lacks a referent within the diegetic context. Annotators must identify such instances where the pronoun is purely a narrative technique (not referring to existing characters in the narrative world) and correctly categorize it as not a character mention. |
| Out-of-storyworld referent | <b>English:</b> Well ... if you could call it a plan.                                                                                                                                               | “you” is purely rhetorical/generic, not a concrete addressee in the story.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Out-of-storyworld referent | <b>Dutch:</b> <i>wat doe je eraan?</i> (what can one do about it?)                                                                                                                                  | “Je” (you) is often used in a general manner, without actually referring to someone in the story.                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Problem                              | Example                                                                                                                                                                                                               | Analysis                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Point of View<br>Unclear             | <b>Dutch:</b> <i>Toriel staart verbaasd naar het gat waarin flowey en jij verdween. Ik hoop dat dat goed gaat.</i> (Toriel stares surprised at the hole in which Flowey and you disappear. I hope that it goes well.) | Some Dutch texts are not very well written, resulting in texts in which “ik” (I) sometimes refers to the narrator and sometimes to a character in the story. In this example it makes most sense to consider “Ik” as referring to the narrator, but it actually refers to Toriel. But note that this could also be a case of represented thought.          |
| Supernatural/<br>Fantasy<br>referent | <b>English:</b> A wolf, who they discovered was named James Ricci, spoke with bitterness practically oozing.                                                                                                          | In fictional scenarios, non-human characters are sometimes treated as full-fledged characters. The absence of linguistic cues typically used in human referents means that coreference must rely on contextual and narrative information.                                                                                                                  |
| Supernatural/<br>Fantasy<br>referent | <b>English:</b> Maybe my soulmate was a soldier in the South Sudanese Civil War, and I’ll never find him because he died.                                                                                             | The story’s narrative world says every person has one real soulmate whose face they see in the mirror when they turn a certain age. At the end of the story, the character Sam’s soulmate is revealed, so he exists. Sam’s soulmate exists in the narrative world, so here Sam is just trying to guess who that is.                                        |
| Identity<br>Transformation           | <b>Italian:</b> <i>Quello che gli sta davanti non è proprio Castiel.</i> (The one standing before him is not really Castiel.)                                                                                         | The body of one character is inhabited by another (Emmanuel inhabiting Castiel’s body). This produces sentences where “Castiel” refers to the old identity, but when the reference is to the new entity a new label should be used for annotation: “Castiel (Emmanuel)”. And sometimes the two are treated as separate characters within the same passage. |

| Problem                 | Example                                                                                                                                                                                                                                                                                                           | Analysis                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Identity Transformation | <b>Korean:</b> “정말 오랜만이야. 우리의 왕” “...크레이비...난 이제...왕이 아니야.” “...그럼 페르엘이라고 할래. 너는 이름과 신분이 많지만, 내가 아는 너의 이름은 그것밖에 없으니까. (“It’s been a really long time. Our king.” “...Clervie...I’m no longer...a king.” “...Then I’ll call you Peruere. You have many names and titles, but that’s the only name I know you by.”) | The character has official name “아를레키노” (Arlecchino) and birth name “페르엘” (Peruere). The text deliberately shifts from the former to the latter in the death scene to mark the identity transformation. It must be decided whether to annotate them as separate entities, switch labels mid-text, or unify them using a single label for pre- and post-death identity. |
| Synecdoche              | <b>Italian:</b> <i>Gli occhi ametista di Viola si spostarono su di lui, osservandolo.</i> (Viola’s amethyst eyes shift toward him, observing him.)                                                                                                                                                                | The subject is not a person but a body part, so there is a semantic vs. grammatical subject mismatch.                                                                                                                                                                                                                                                                  |

## 2. Language-specific Issues and Annotation Tool Limitation

Beyond shared challenges, each language presents unique structural idiosyncrasies that create specific hurdles for annotation systems and guidelines. These often stem from morphological features not present in other languages as Table 4 shows.

- Morphological attachment is a critical issue for agglutinative languages like Bahasa Indonesia and Korean. In Bahasa Indonesia, the clitic “-nya” can function as a possessive pronoun, a referent to an event, or a part of a fixed conjunction, requiring disambiguation. Similarly, Korean postpositional particles (e.g., subject marker “-이” or “-가”) attach directly to nouns, and some annotation tools cannot segment them, forcing the inclusion of non-referential grammatical markers within character mention span.
- Languages like Chinese, which form words through the flexible combination of individual characters, present unique challenges in word segmentation—a task that remains notoriously difficult due to significant variation in rules across different contexts and historical periods, with no one-to-one correspondence to English grammatical conventions. For example, the reflexive compound “你自己” (yourself) has been determined through discussion to be annotated as a single unit, even though it comprises both a pronoun (“你” [you]) and a reflexive marker (“自己” [self]), which can be both used independently. This challenges strict grammatical segmentation and highlights how annotation guidelines must sometimes prioritize functional unity over morphological decomposition to maintain consistency in referential tracking. The Dutch reflexive pronoun variants “*hijzelf*” and “*hij zelf*” present a similar case as orthographic separation.
- Cultural-linguistic hybridity further complicates annotation. Fanfiction frequently incorporates untranslated honorifics (e.g., Japanese “-sama”, Korean “-hyung”) and faces transliteration variance, where a single foreign character name (e.g., Franz/Ferenc) is rendered into completely different strings in Hangul, obscuring coreference.
- Languages like Italian exhibit pronominal verb complexity, where a single verb form (e.g., “*risponderle*”) implicitly encodes multiple participants, necessitating the annotation of multiple zero pronouns in one location.

These language-specific phenomena highlight the need for tailored annotation protocols and

tool enhancements to handle diverse linguistic architectures.

Table 4: Language-specific issues and annotation tool limitation examples

| Language         | Example                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Problem Analysis                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Chinese          | 杀掉你自己吗? (kill yourself?)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | The reflexive compound “你自己” (yourself) is annotated as a single unit, though it contains both a pronoun “你” (you) and a reflexive marker “自己” (self), challenging strict grammatical segmentation.                                                                                                                                                                                                                                                       |
| Dutch            | <p><i>Izzy is niet ver genoeg gezakt om toe te geven dat hij zelf ook meezingt met Watermelon Sugar als hij alleen is. ( Izzy hasn’t sunk low enough yet to admit that he also sings along to Watermelon Sugar when he’s alone. )</i></p> <p><i>Hij zit niet te wachten op iemand die naast hem komt zitten, maar hij vindt het zelf strontirritant als mensen hun rugzak op een zitplaats zetten terwijl het druk is. (He’s not exactly waiting for someone to come sit next to him, but he finds it fucking annoying when people put their backpack on a seat while it’s crowded. )</i></p> | <p>“Hijzelf” (himself) can be used as one word but can also be used as separate words. The alternation between the single-word form “<i>hijzelf</i>” and the separated form “<i>hij zelf</i>” represents an instance of orthographic variation impacting coreference annotation. While both forms are functionally equivalent, the separated form creates ambiguity in tokenization and mention’s boundary detection.</p>                                 |
| Bahasa Indonesia | <p><i>Diambilnya sehelai mie, lalu dimasukkannya ke dalam mulut hingga separuhnya menjuntai. (He took a strand of noodles, then put it into his mouth until half of it was dangling.)</i></p> <p><i>Dinyalakannya keran air, buih muncul di pori-pori spons (He turned on the water tap, and bubbles appeared in the pores of the sponge.)</i></p>                                                                                                                                                                                                                                            | <p>Passive constructions with implicit agents. In written narrative Bahasa Indonesia this is common but in spoken Bahasa Indonesia is very rare. These sentences use the “<i>di-verb-nya</i>” form, an agentive passive with an implied subject (e.g., a specific character). This structure focuses on the action rather than the actor, aligning with a descriptive narrative style. In everyday speech, these would typically be active sentences.</p> |

| Language                                 | Example                                                                                                                                                                                         | Problem Analysis                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Bahasa Indonesia</b>                  | <p><i>Adiknya</i> (His/Her younger sibling)</p> <p><i>Dia tidak lagi memikirkannya.</i><br/>(He/She no longer thought about it.)</p> <p><i>seharusnya</i> (should) / <i>seandainya</i> (if)</p> | <p>Multiple meanings of the suffix “-nya”: as a possessive pronoun, a reference to a prior idea/event, or as part of fixed conjunctions. Correctly distinguishing these uses is essential for accurate annotation.</p>                                                                                                                                                                                                                                                                                                             |
| <b>Bahasa Indonesia, Chinese, Korean</b> | <p>“내일부터는 시재점검 꼼꼼하게 해야겠네. 페렌츠한테도 이야기 해줘야겠다.” (I’ll have to do a thorough re-examination from tomorrow. I’ll also tell Ferenc.)</p>                                                              | <p>Name Translation. Korean transliteration can mask a character's identity, as seen with “페렌츠” (Ferenc, in Hungarian) and “프란츠 리스트” (Franz Liszt, in German) — the same person in different languages. This requires fandom (or real-world) knowledge to resolve.</p> <p>Cultural terms, such as the Korean “<i>hyung</i>”, the Russian <i>котенок</i> (kitten/endearment), or Japanese honorifics (-<i>chan</i>, -<i>sama</i>) appear frequently. Recognizing these is key to annotating character relationships accurately.</p> |
| <b>Italian</b>                           | <p><i>Si limitò a risponderle.</i> (He limited himself to replying to her.)</p>                                                                                                                 | <p>The verb form “<i>risponderle</i>” encodes both an implicit subject (“he”) and an indirect object (“to her”), requiring the annotation of multiple zero pronouns for a single verb.</p>                                                                                                                                                                                                                                                                                                                                         |
